

How to plot from Corel Draw 12

Note: Make sure Corel Draw is open, and the drawing you intend to cut or plot is ready.

1. Make sure all of the objects to be plotted/cut, are grouped together and selected. Place the drawing in the lower left corner of the page.
2. Select the drawing and go to the file drop-down menu and select **EXPORT**.
3. Name the file, and pick the folder where you want to put the file. Below the file name under "Save as type", select **"HPGL plotter file (PLT)"** from the drop down menu. In the bottom right corner check the box that says "Selected only" (Make sure your drawing has been selected first) hit the EXPORT button.
4. Under the "Page" tab; Plotter origin should be **"Bottom Left"**. Plotter units should read **"1000"**.
5. Under the "Advanced" tab; **Curve resolution should read 0.001 Inches**. Nothing else should have a check in it.
6. Hit the OK button. Your plot file has been saved to the folder, and name of your choice
7. Now, click on "File", then Send Cut/Plot file. Find your plot file (the one you saved from Corel Draw earlier). Click on it, and click OK. The cutter will now start to plot or cut out the drawing.
